Usutu and West Nile virus

- Transmitted between birds and mosquitoes
- Antigenetically similar
- Overlapping host range: 34 bird species that can get infected with both
- Overlapping vector range: most frequently detected in *Culex pipiens* mosquitoes

Nikolay 2015.

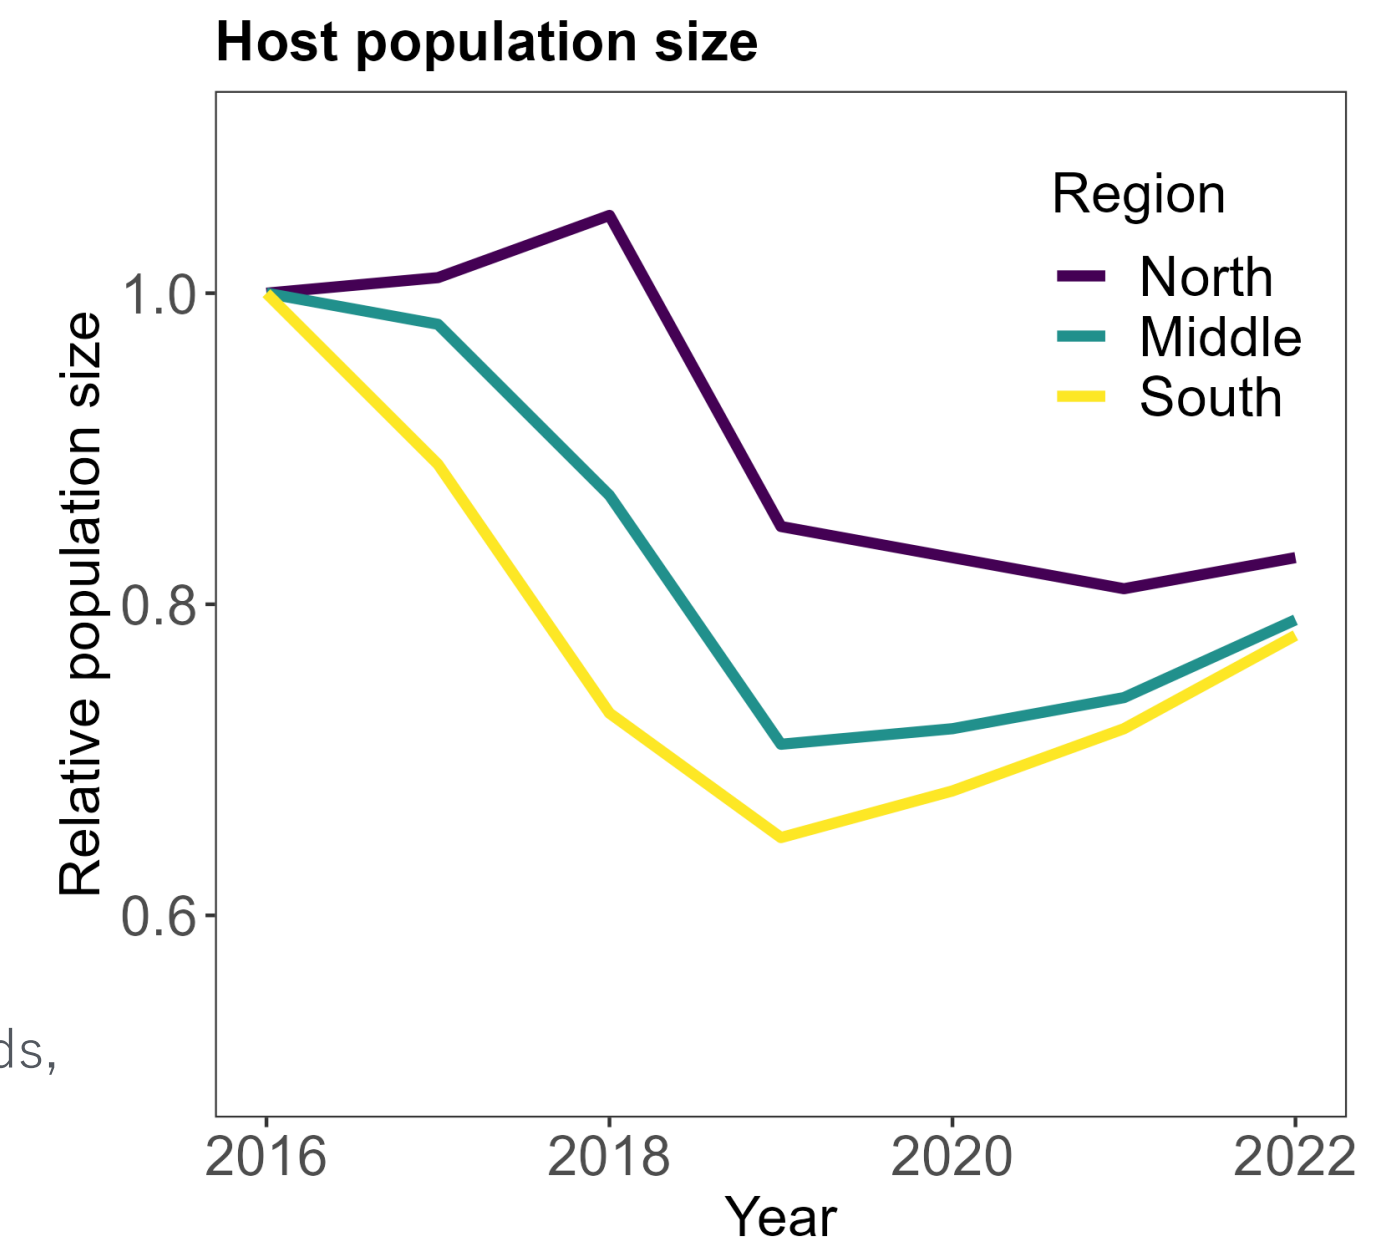

Nikolay 2015.

- WNV: larger impact in humans and horses
- Usutu: blackbirds most severely affected

Nikolay, B, A review of West Nile and Usutu virus co-circulation in Europe: how much do transmission cycles overlap?, Transactions of The Royal Society of Tropical Medicine and Hygiene, Volume 109, Issue 10, October 2015, Pages 609–618.

Data: trap counts

Ibañez-Justicia, A., et al. National mosquito (Diptera: Culicidae) survey in the Netherlands 2010–2013. *Journal of Medical Entomology* 52.2 (2015): 185-198.

Van Bortel, W, et al. MODIRISK: Mosquito vectors of disease, collection, monitoring and longitudinal data from Belgium. *Gigabyte2022* (2022): 1-15.

Data: blackbird point counts

NL: Meetnet Urbane Soorten & Meetnet Agrarische Soorten
FR: Common Bird Monitoring Scheme

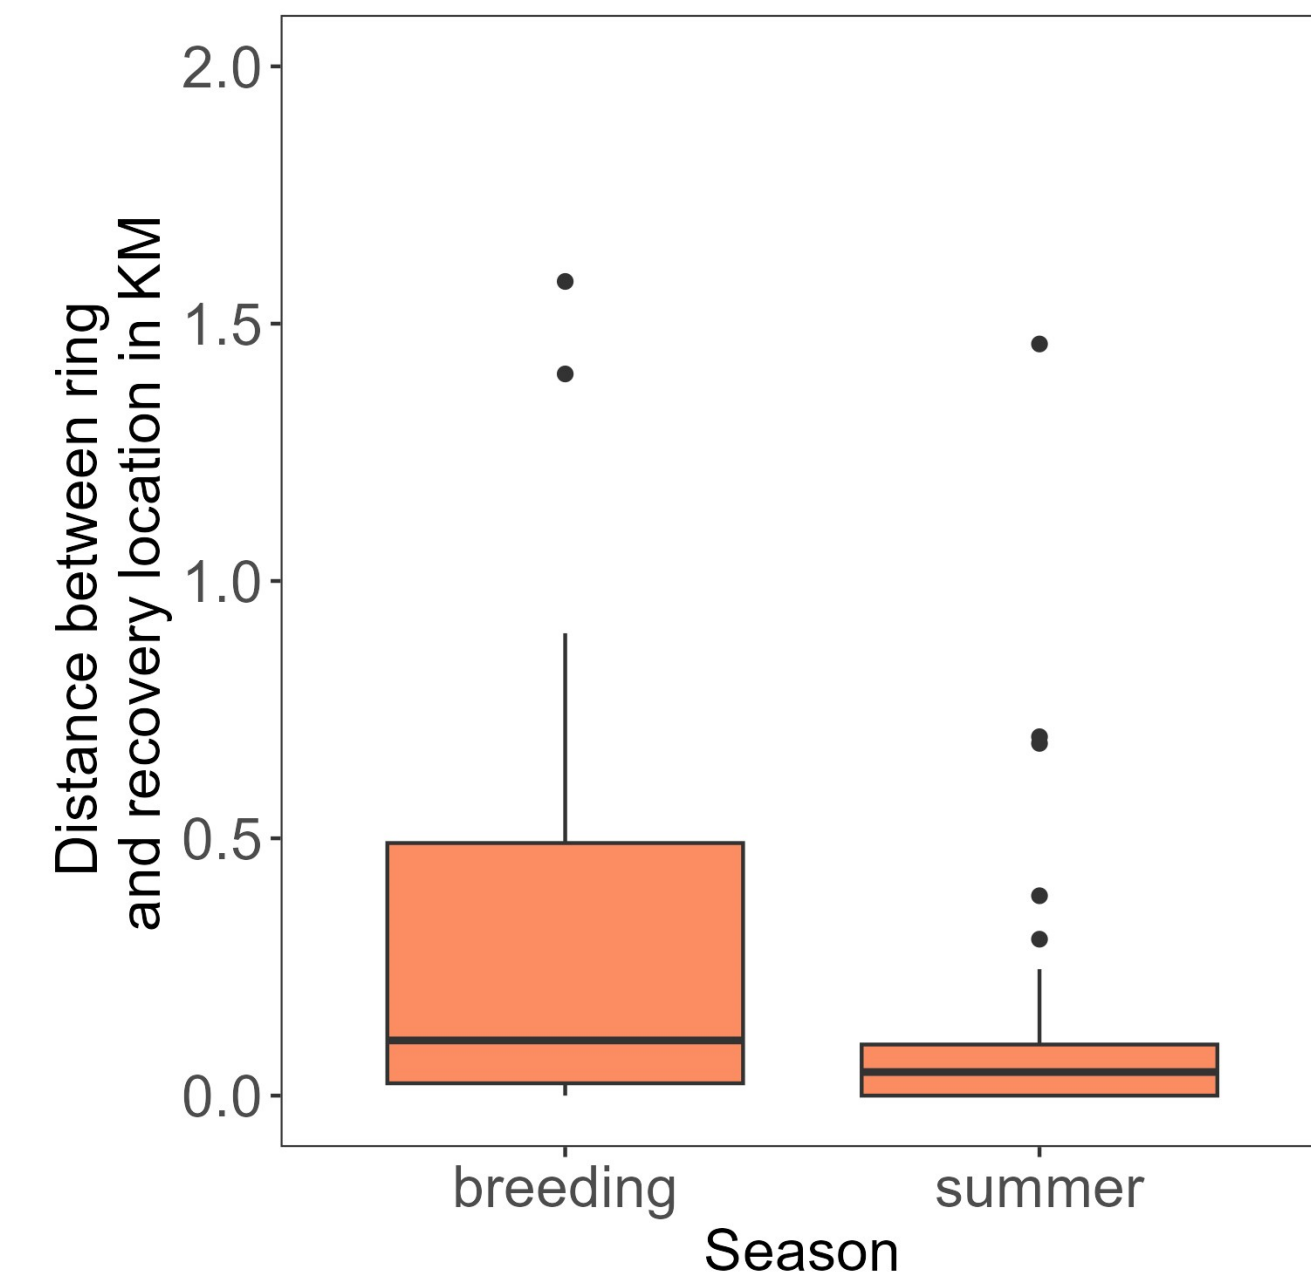

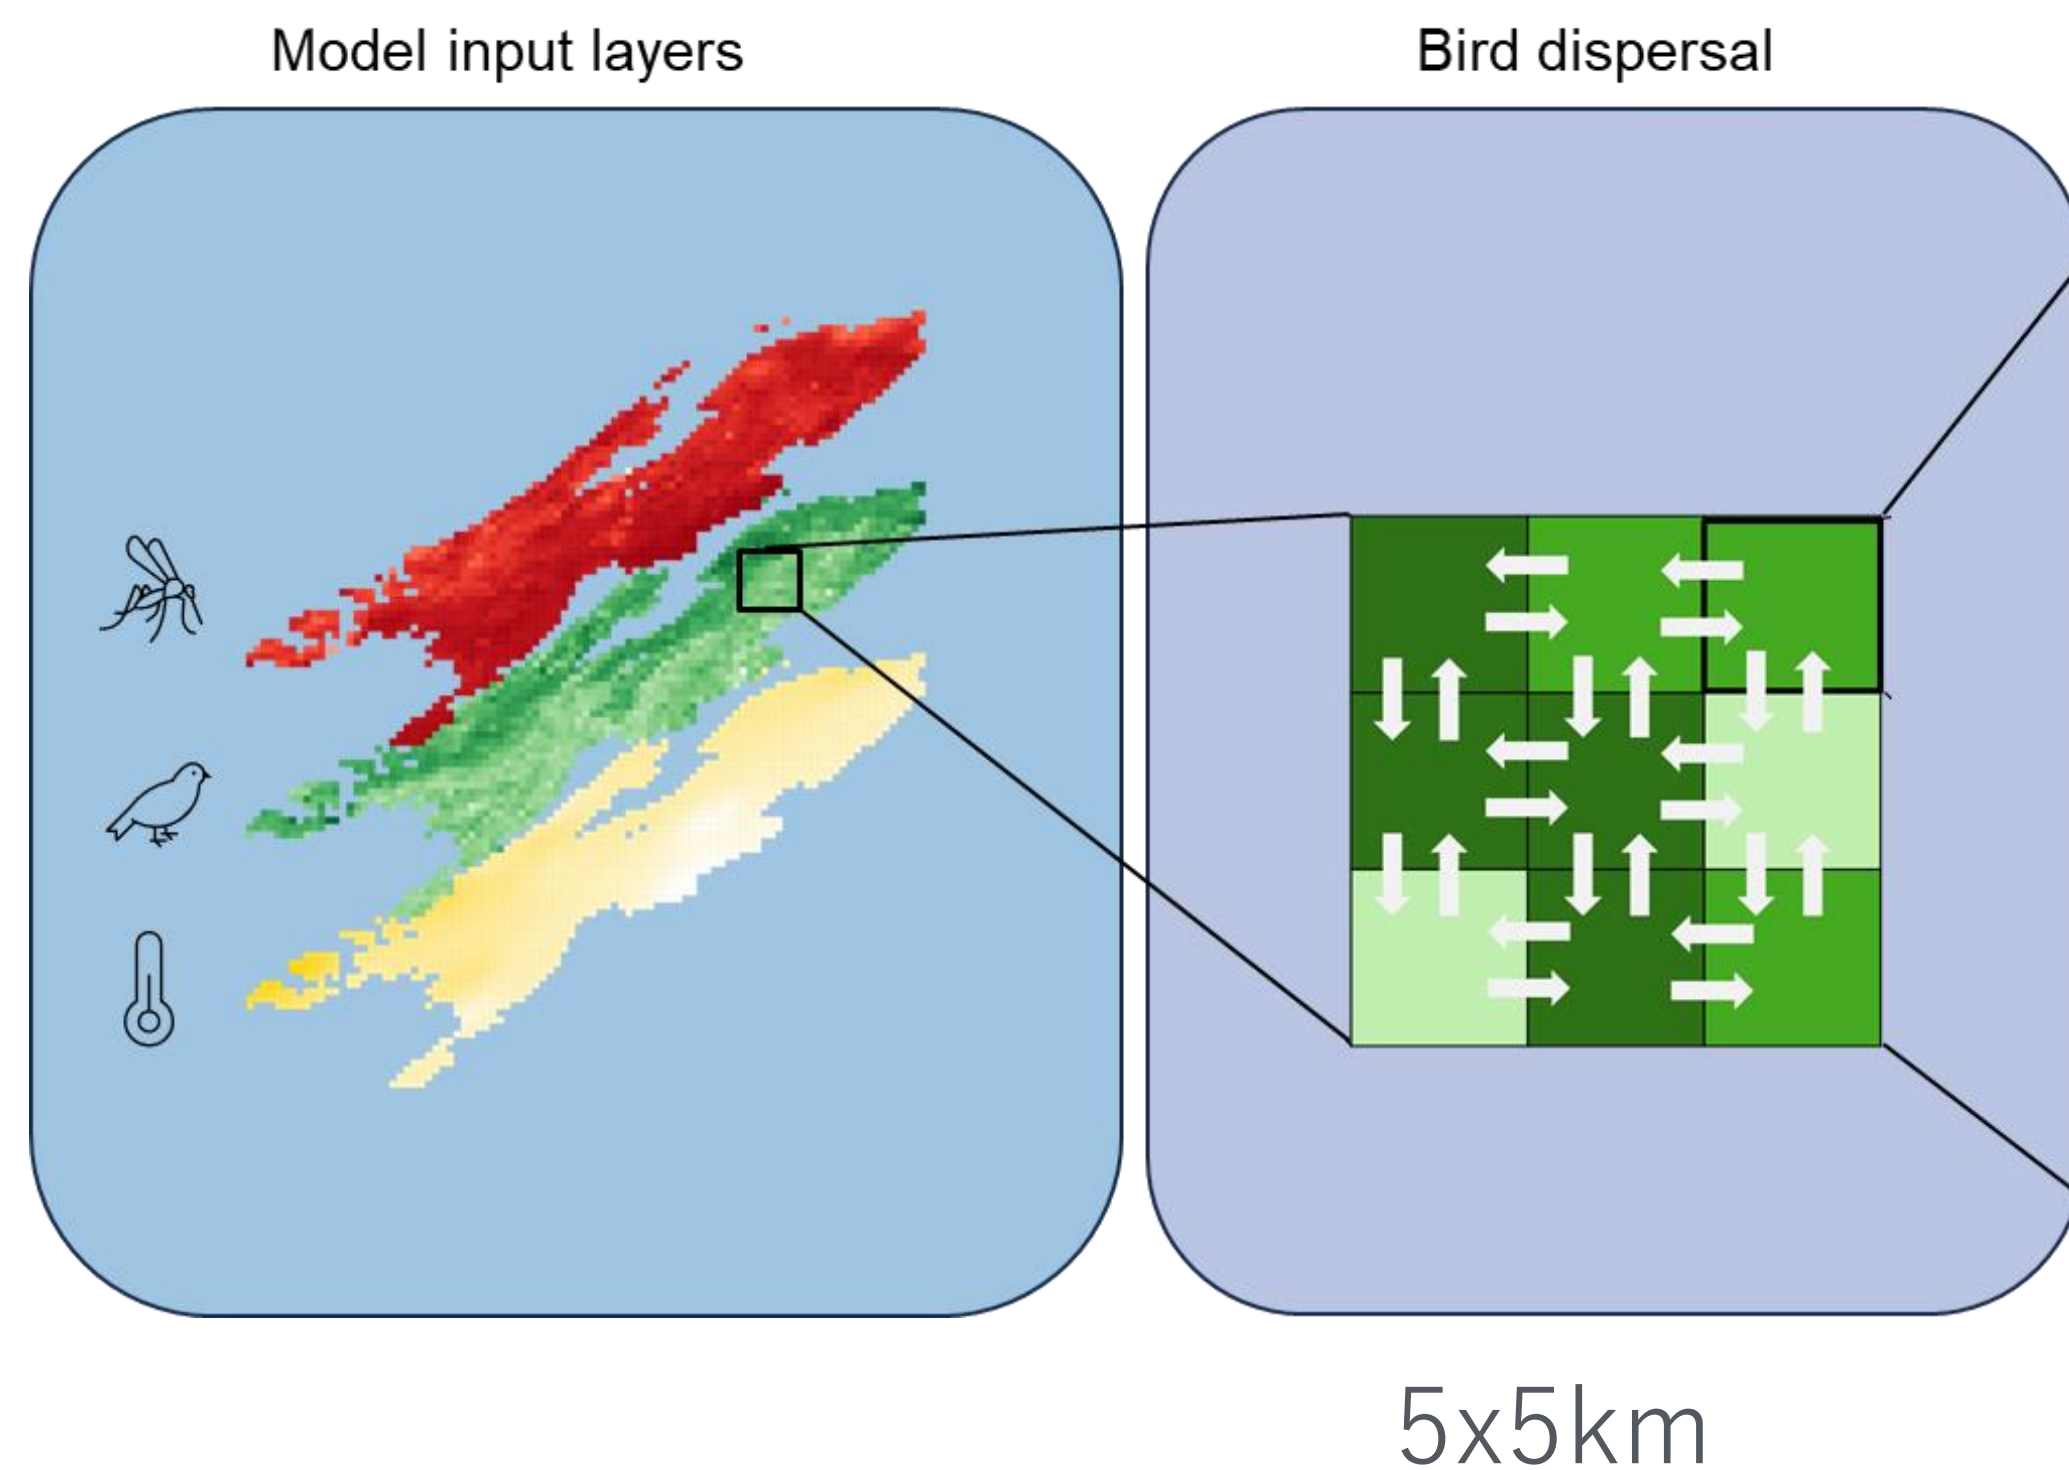

Transmission model

Bird movement

Daily dispersal (breeding vs non-breeding season)

Natal/breeding dispersal

No mosquito movement

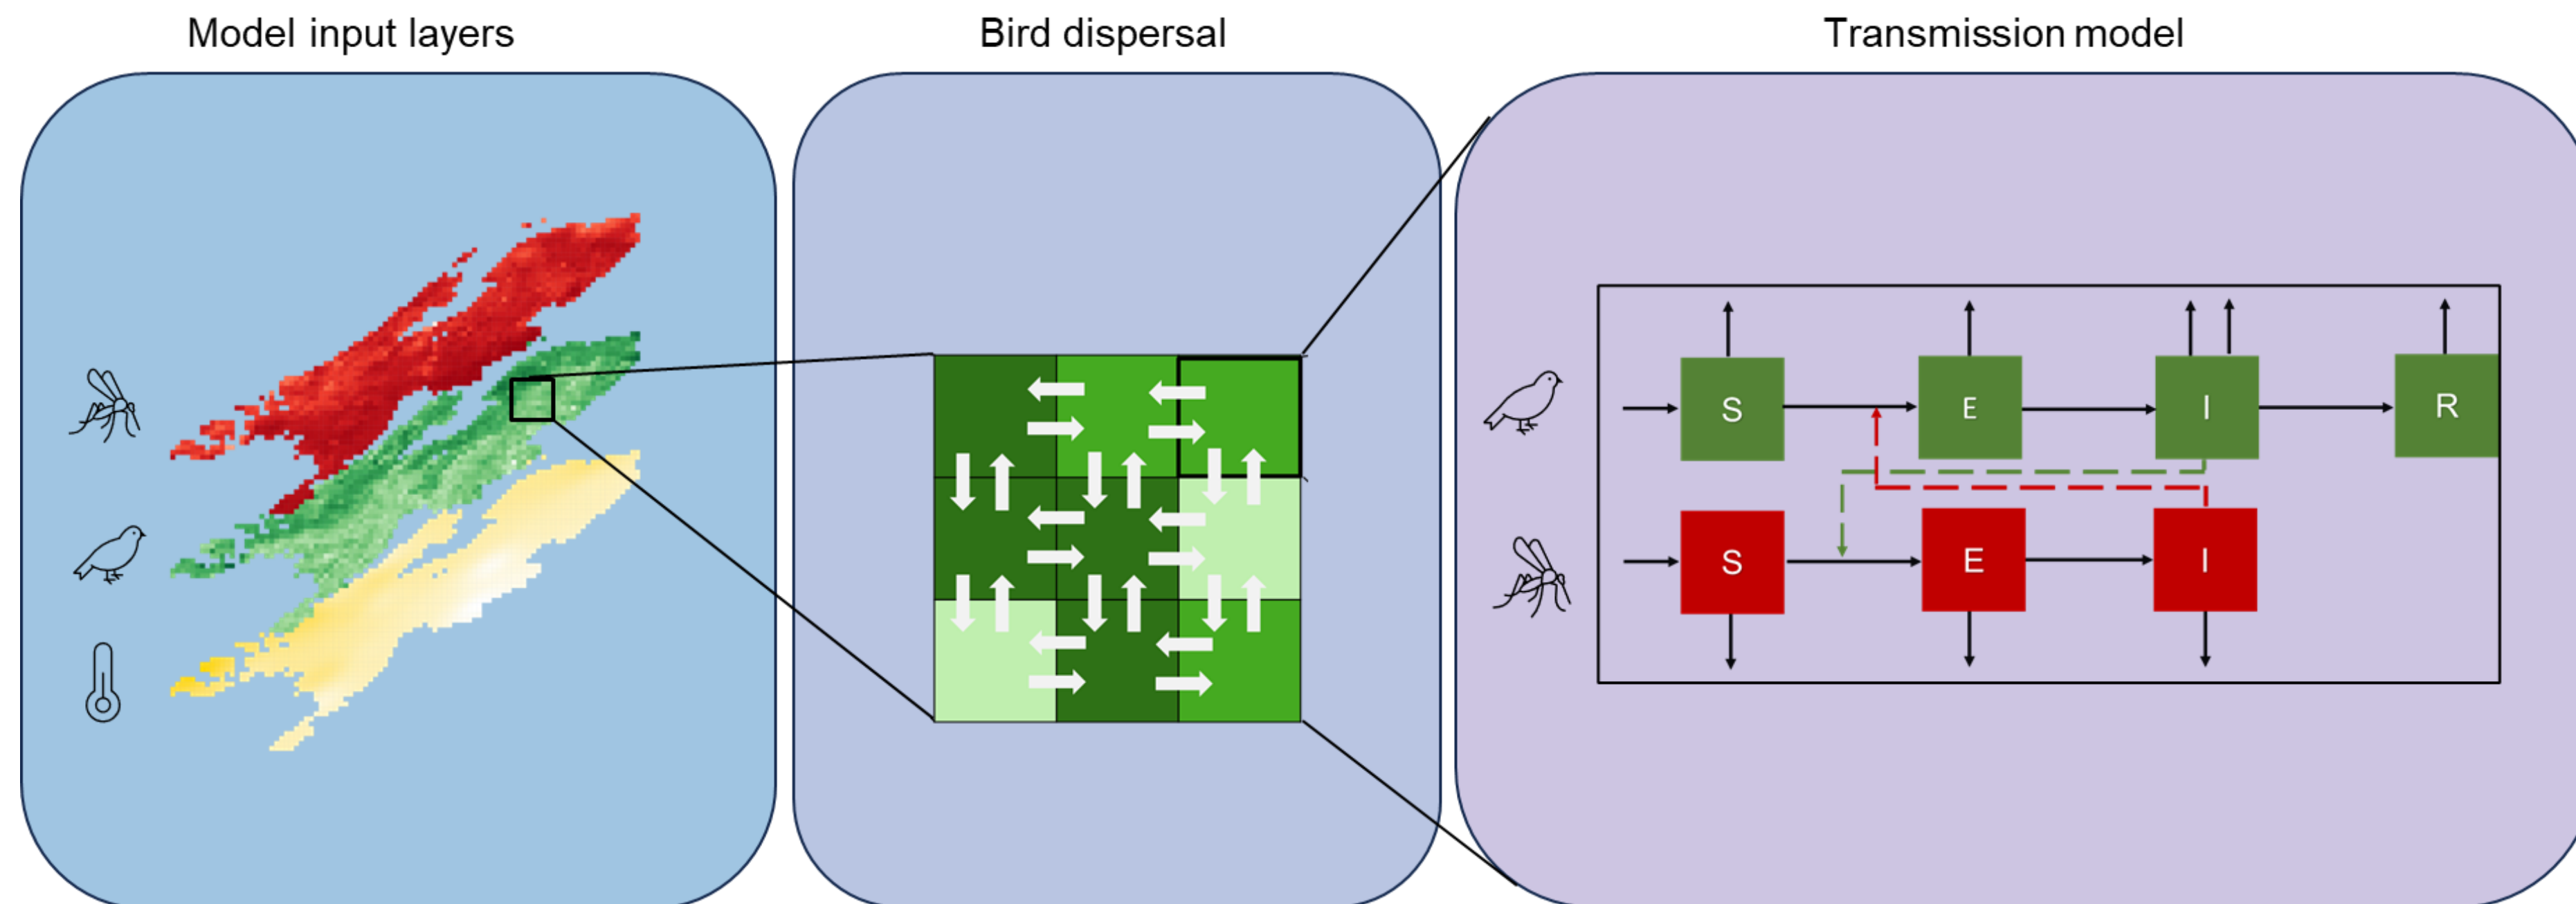

Data: Vogeltrekstation NIOO-KNAW ringing and dead recoveries of blackbirds in the Netherlands

Transmission model

Infection dynamics

Biting rate & extrinsic incubation period & mosquito mortality

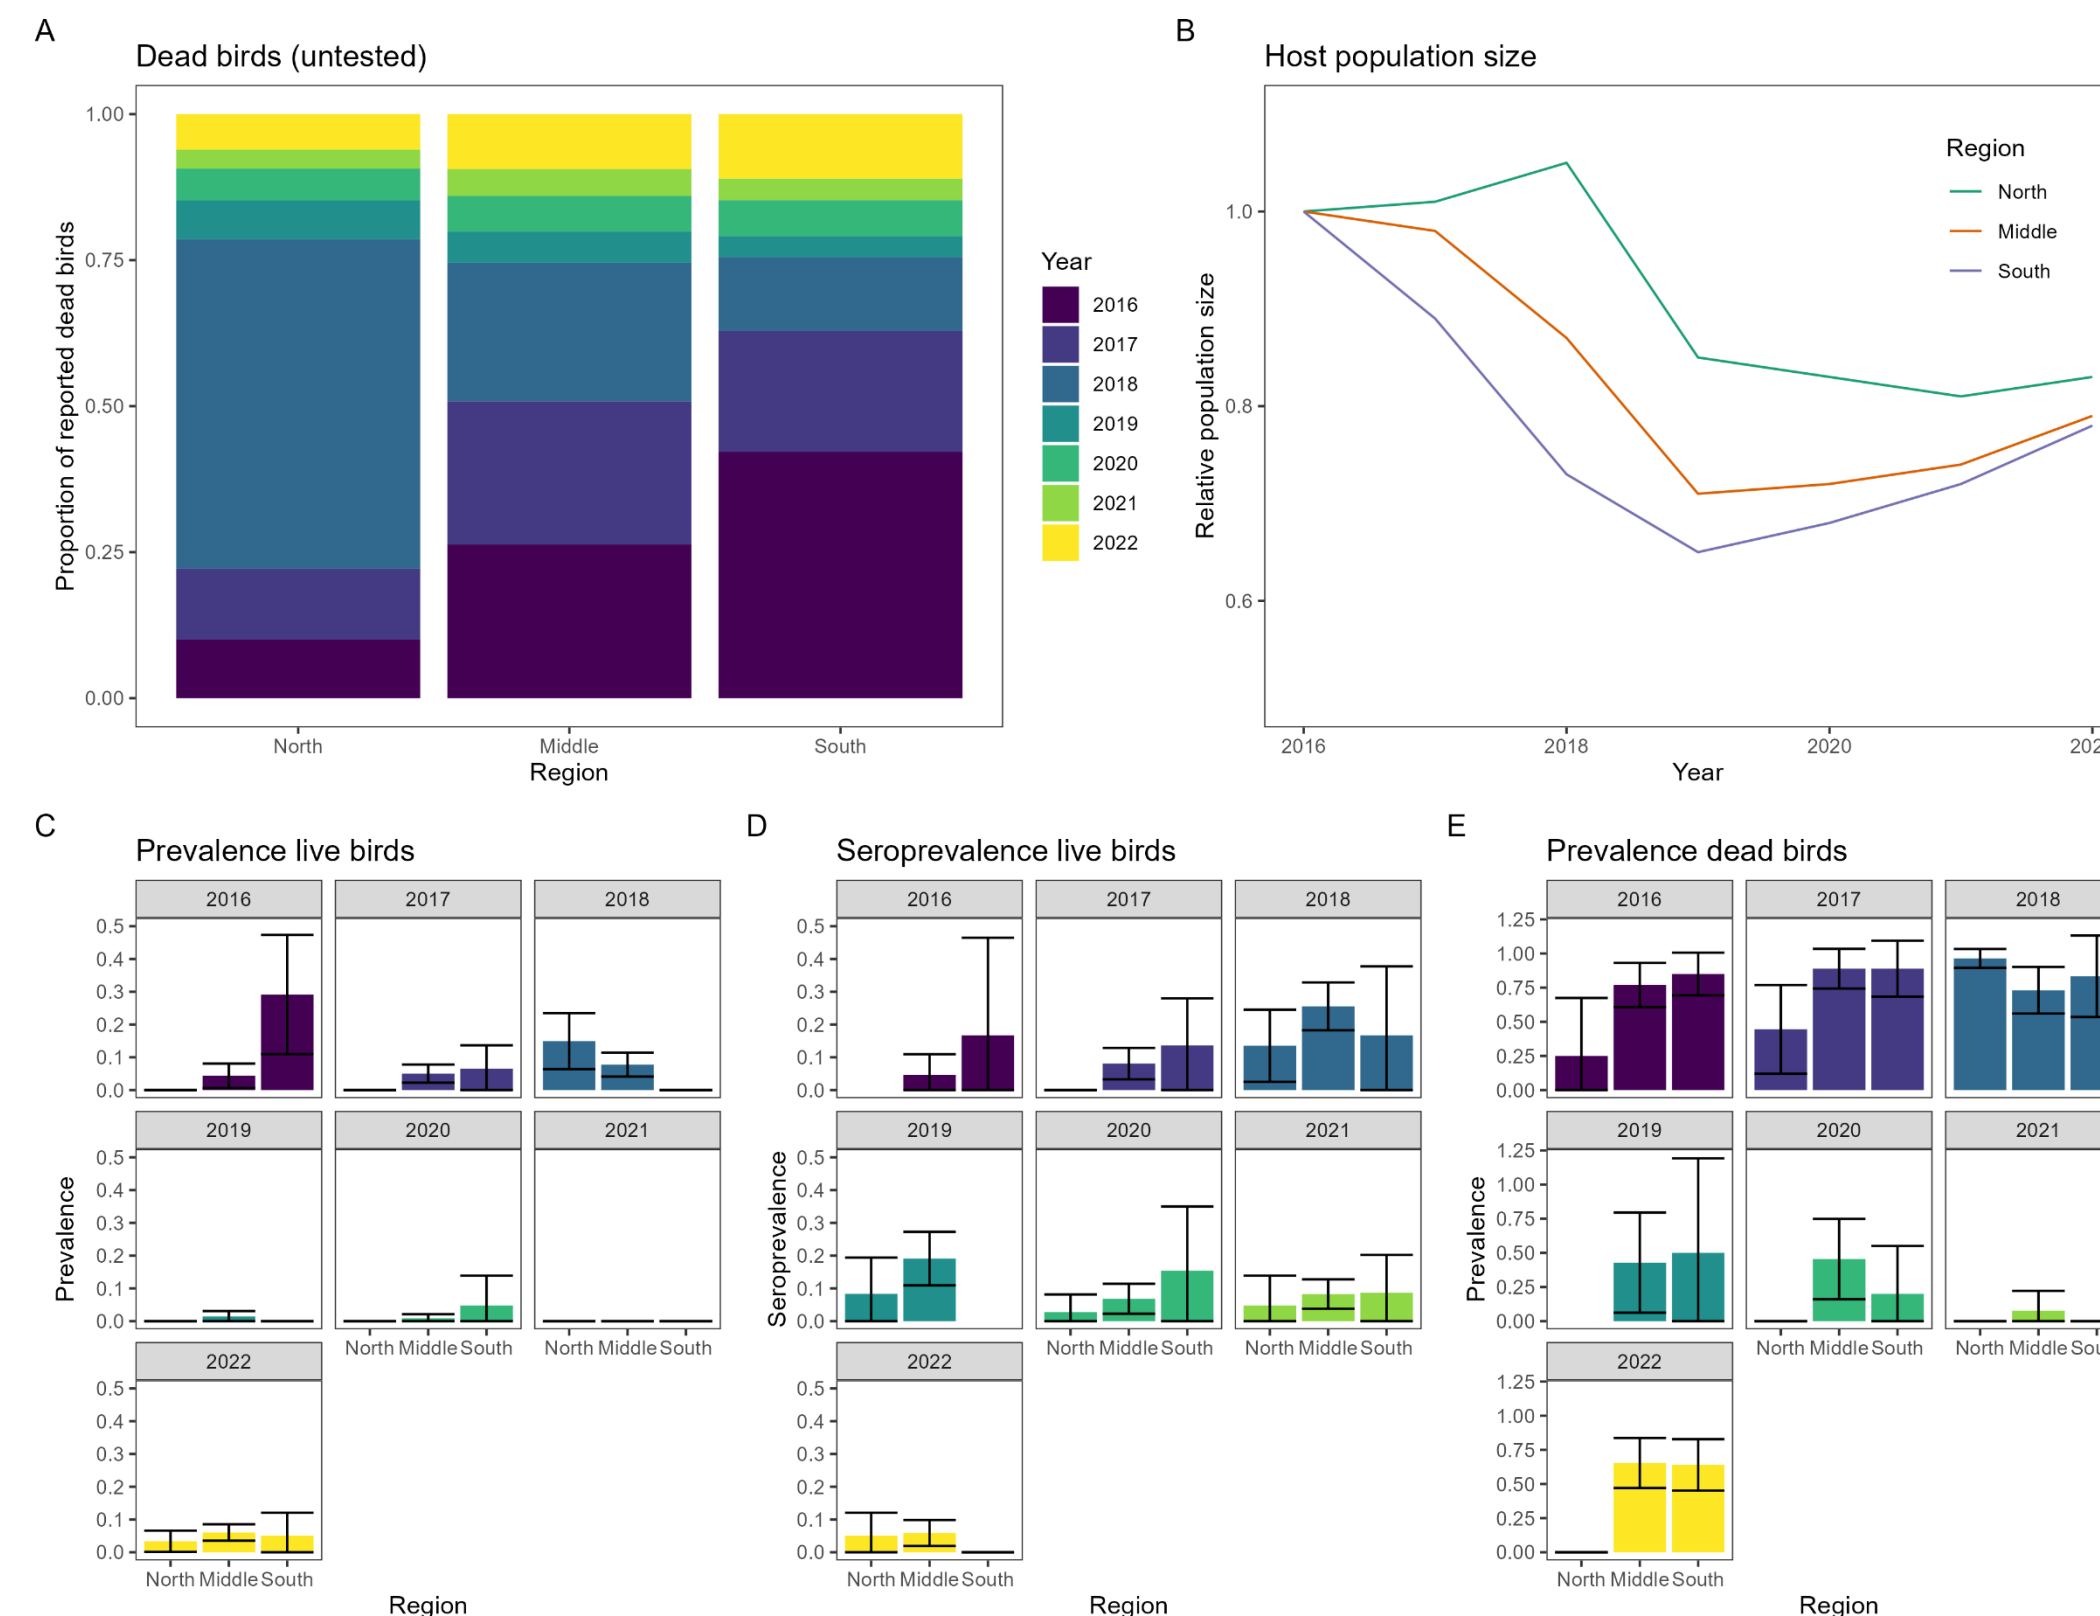

Inference

Model calibration

Approximate Bayesian Computation with SMC sampler

- Calibration to multiple aspects of outbreak by using several types of blackbird surveillance data
- Use of summary statistics from full datasets
- Incorporate observation process when known

Impact of future scenarios on transmission risk

Conclusion

Conclusion

Although blackbirds are most severely affected, blackbirds alone can not explain the observed spread of Usutu virus.

Other (bird) species, that **disperse further** than blackbirds and **develop more immunity**, contributed significantly to Usutu virus transmission.

Risk and size of Usutu virus outbreaks is expected to increase in possible future scenarios.

Extra slides

Characterising the unobserved reservoir

Limited mortality from infection

Further dispersal than best estimate for blackbirds

Little to no immunity from prior transmission

Longer lifespan than blackbirds
6.9 years (95%CI 1.6 – 11.8)

Around 35 times more bites than on blackbirds

Reservoir species

Species with seroprevalence higher than blackbirds in NL surveillance or Austrian study by Meister et al. (2008)

Species	Adult lifespan
blackbirds,	3
blackcaps (<i>Sylvia atricapilla</i>),	2
long-eared owl (<i>Asio otus</i>),	4
doves (<i>Streptopelia decaocto</i>),	3
jackdaws (<i>Corvus monedula</i>),	5
robins (<i>Erithacus rubecula</i>),	2
crows (<i>Corvus corone</i>),	4
magpies (<i>Pica pica</i>),	5
song thrushes (<i>Turdus philomeus</i>)	3

Also experimental study

Estimate:
6.9 years (95%CI 1.6 – 11.8)

Model versions

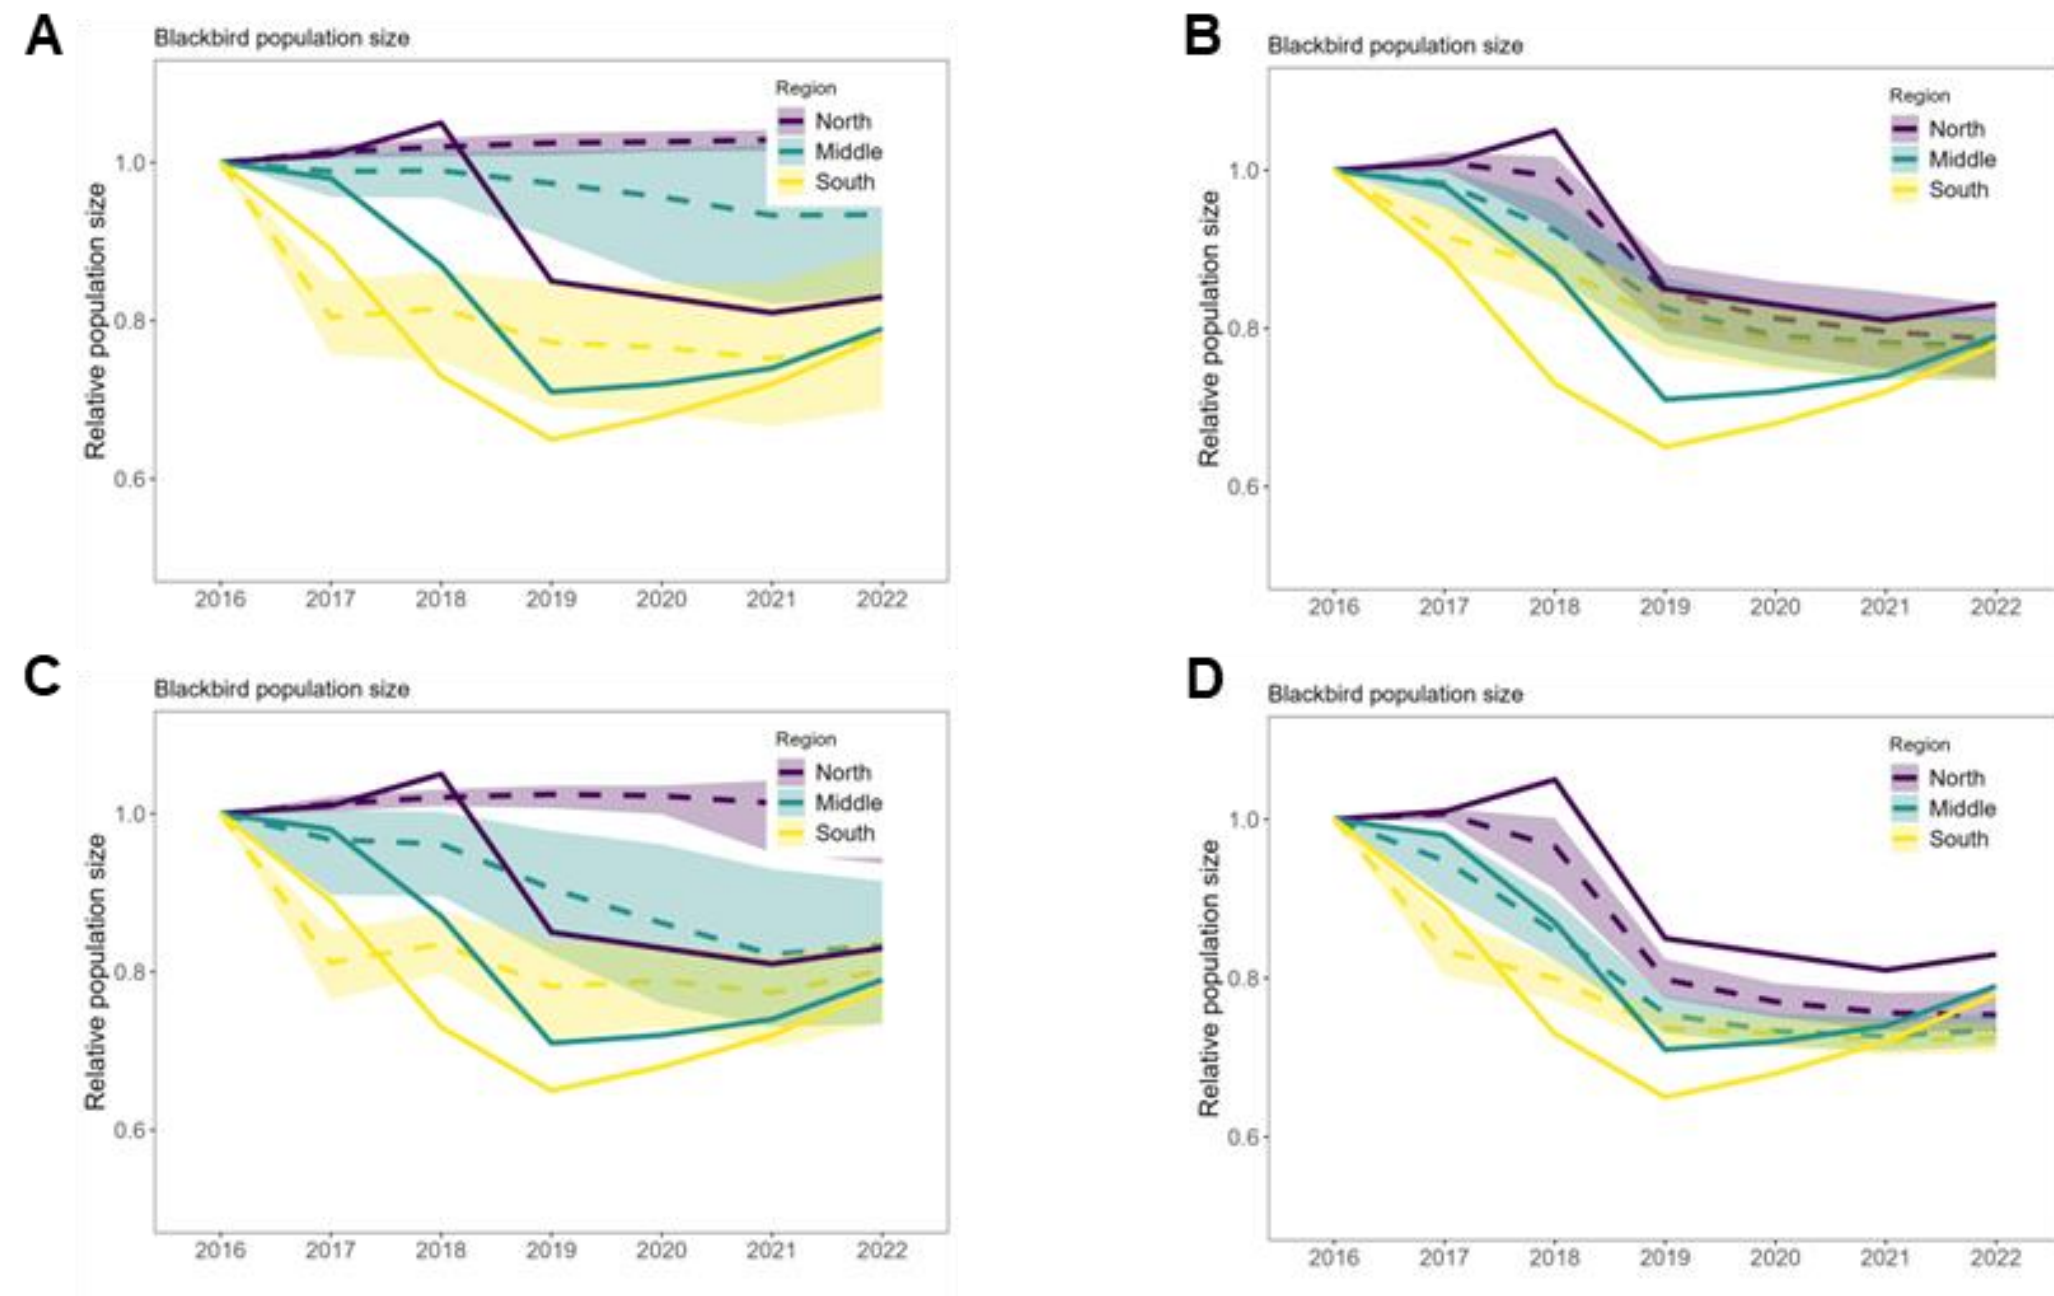

Table 1: Specification of model versions

	Virus introduction	Host species	Characteristics other host species			
			Infection mortality ratio	Lifespan	Dispersal distance	Population distribution
A	South	Blackbird	NA	NA	NA	NA
B	South	Blackbird & other	Blackbird-like	Blackbird-like	Increased	Blackbird-like
C	South	Blackbird & other	Zero	Estimated	Blackbird-like	Blackbird-like
D	South	Blackbird & other	Zero	Estimated	Increased	Blackbird-like
Sensitivity analyses*						
S1	Everywhere	Blackbird & other	Zero	Estimated	Increased	Blackbird-like
S2	South	Blackbird & other	Zero	Estimated	Increased	Uniform
S3	South	Blackbird with alternative dispersal** & other	Zero	Estimated	Blackbird-like with alternative dispersal**	Blackbird-like

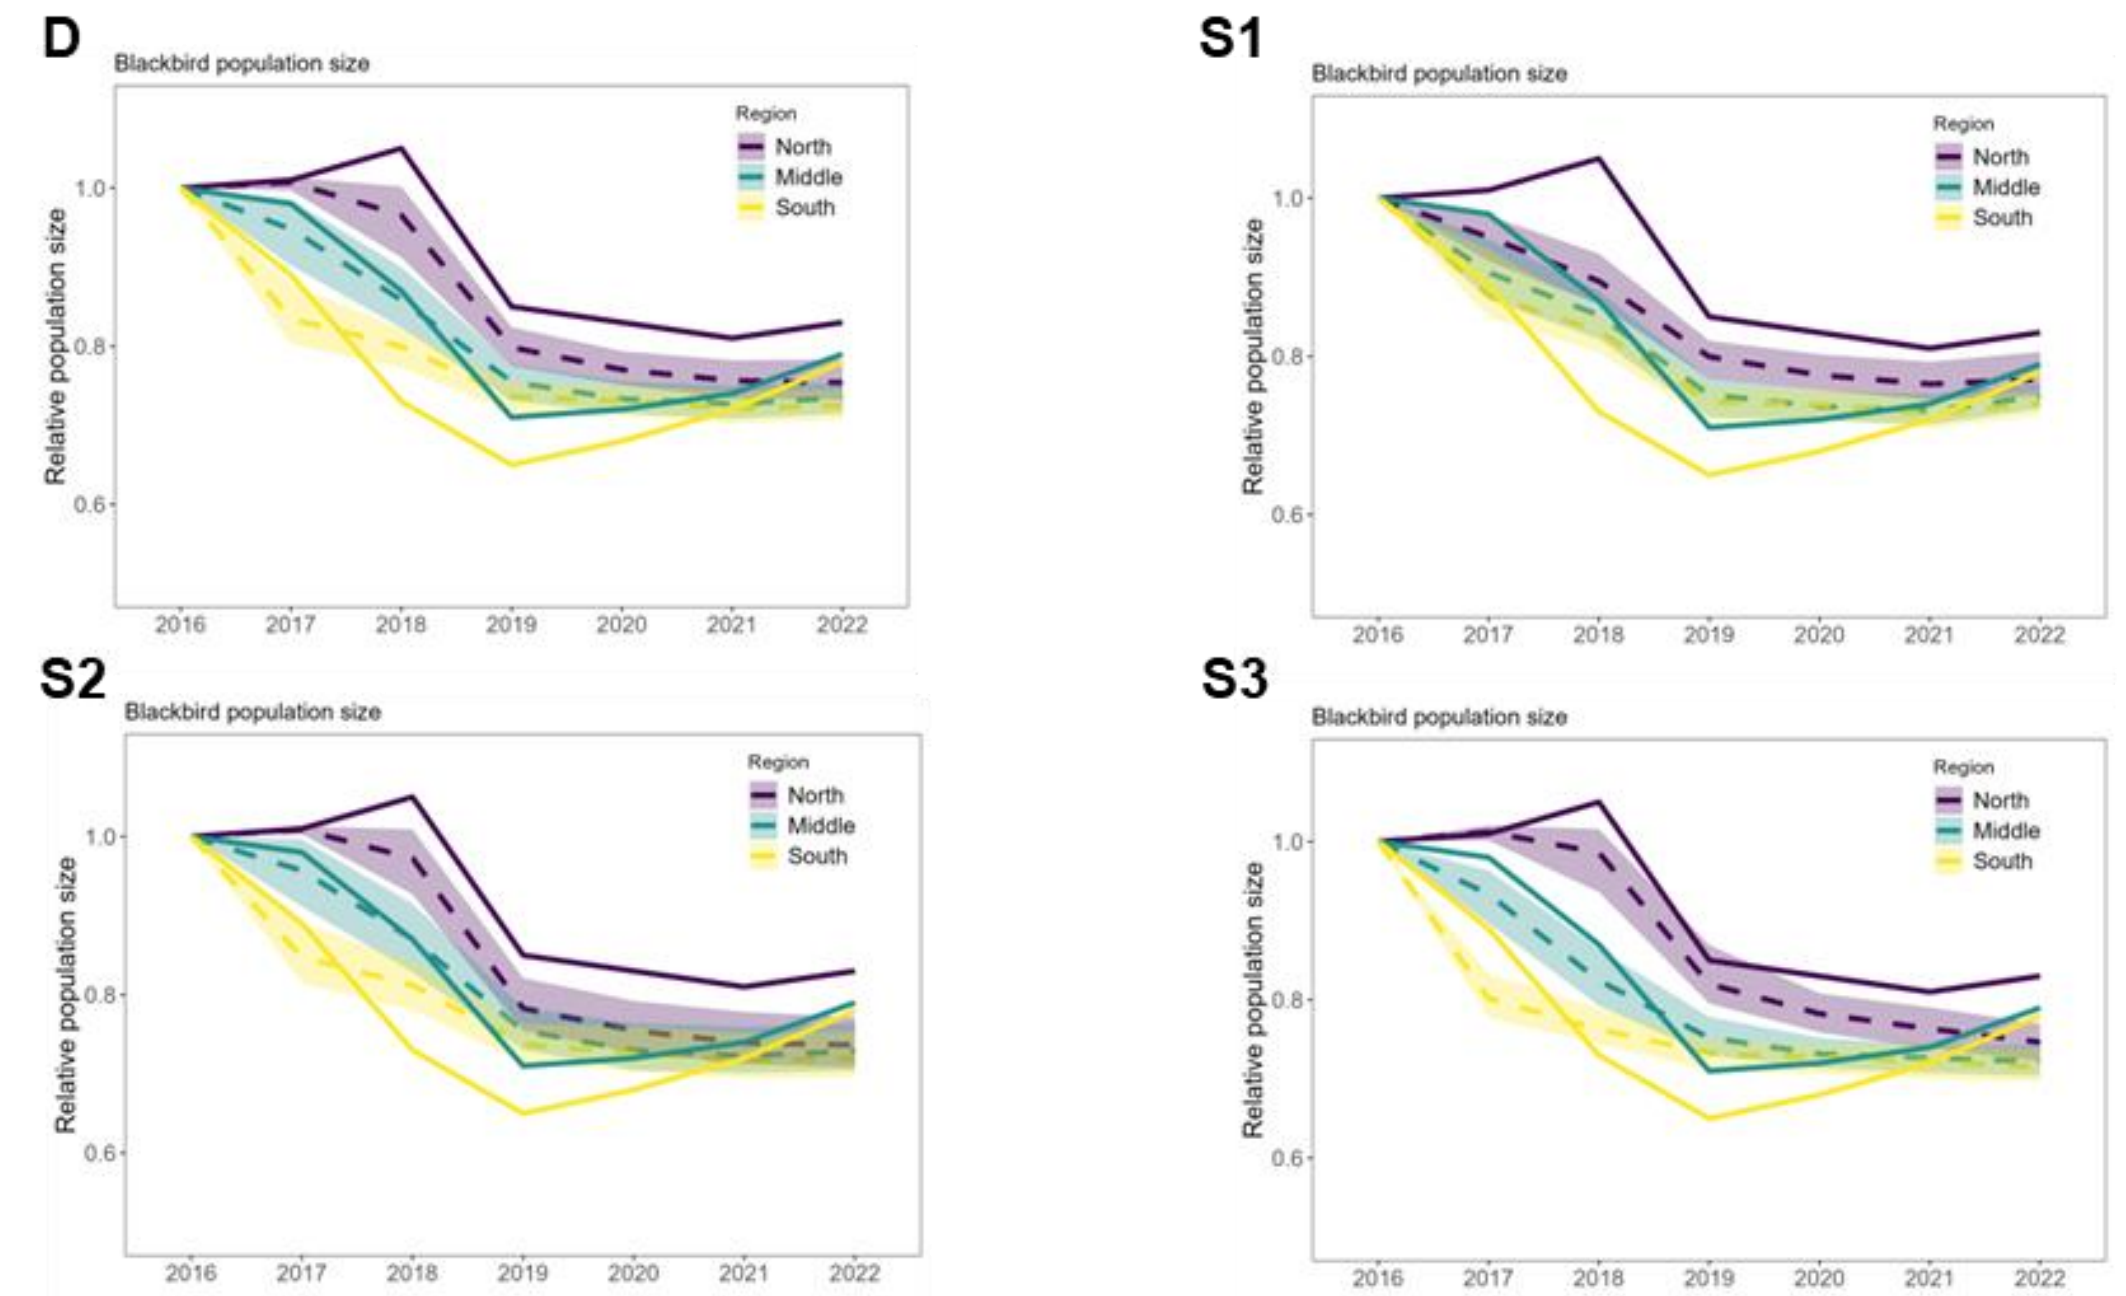

* Sensitivity analyses were based on model D, because this was the best-fitting model from options A-D.

** In the 'blackbird-like with alternative dispersal' scenario, post-breeding season movement was increased to equal breeding season movement.
